Part of WJEC

Student Record

Topic	Specified practical work	Date completed	Competency					Teacher / Student comments
			1	2	3	4	5	
Basic physics	Measurement of the density of solids							
	Determination of unknown masses by using the principle of moments							
Kinematics	Measurement of g by freefall							
Dynamics	Investigation of Newton's 2nd Law							
Solids under stress	Determination of Young modulus of a metal in the form of a wire							
	Investigation of the force-extension relationship for rubber							
Resistance	Investigation of the I-V characteristics of the filament of a lamp and a metal wire at constant temperature							
	Determination of resistivity of a metal							
	Investigation of the variation of resistance with temperature for a metal wire							
D.C. circuits	Determination of the internal resistance of a cell							
The nature of waves	Measurement of the intensity variations for polarisation							
Wave properties	Determination of wavelength using Young's double slits							

eduqas Part of WJEC

Student Record

	Determination of wavelength using a diffraction grating							
	Determination of the speed of sound using stationary waves							
Refraction of light	Measurement of the refractive index of a material							
Photons	Determination of h using LEDs							
Vibrations	Measurement of g with a pendulum							
	Investigation of the damping of a spring							
Thermal physics	Estimation of absolute zero by use of the gas laws							
	Measurement of the specific heat capacity for a solid							
Capacitance	Investigation of the charging and discharging of a capacitor to determine the time constant							
	Investigation of the energy stored in a capacitor							
Nuclear decay	Investigation of radioactive decay – a dice analogy							
	Investigation of the variation of intensity of gamma radiation with distance							
Magnetic fields	Investigation of the force on a current in a magnetic field							
	Investigation of magnetic flux density using a Hall probe							

THE COMPETENCIES

1. Follows written procedures
2. Applies investigative approaches and methods when using instruments and equipment
3. Safely uses a range of practical equipment and materials
4. Makes and records observations
5. Researches, references and reports

Guidance Notes

In general, you should be able to:

- apply investigative approaches and methods to practical work and think independently when undertaking practical work**;**
- use a wide range of experimental and practical instruments, equipment and techniques appropriate to the knowledge and understanding included in the specification.

Methods of data collection and analysis

You should be able to:

- describe with the aid of a clearly labelled diagram, the arrangement of apparatus for the experiment and the procedures to be followed;
- describe how the data should be used in order to reach a conclusion, including details of derived quantities and graphs to be drawn where appropriate;
- select appropriate apparatus and record the instrument resolution used i.e. the smallest measurable division on the instrument;
- set up apparatus correctly without assistance and follow instructions given in the form of written instructions, diagrams or circuit diagrams;
- undertake and record trial readings to determine the suitability of ranges and intervals;
- take repeat readings where appropriate;
- make and record accurate measurements;
- evaluate experimental methods and suggest improvements.

Safety considerations

You should be able to:

- assess the risks of your experiment;

Hazard	Risk	Control measure

Hazard - an object or chemical and the nature of the hazard

Risk - an 'action' in the method that can create a risk from a hazard

Control measure - must be practicable in the context of the practical

- describe precautions that should be taken to keep risks to a minimum.

Table of results

You should be able to:

- present numerical data and values in a single clear table of results;
- produce column headings which have both a quantity and unit e.g. I/mA;
- include columns for all the initial data and values calculated from them;
- record initial data to the same number of decimal places as the instrument resolution e.g. if length is measured to the nearest mm then all lengths in the column should be recorded to the nearest mm;
- use the correct number of significant figures for calculated quantities. For example, if values of pd and current are measured to 2 and 4 significant figures then the corresponding resistance should be given to 2 or 3 significant figures. The number of significant figures may, if necessary, vary down a column of values for a calculated quantity.

Recording readings and significant figures

All raw data should be recorded to the resolution of the instrument used. Any data processed (calculated) from the raw data should be to the same number of significant figures (or a maximum of one extra) as the raw data. The number of significant figures should be consistent within a column of data.

To simplify things a general rule is that:

Processed data should be given to the same number of significant figures as raw data and raw data should always be quoted to the resolution of the instrument used to measure it

Approach to data analysis

You should be able to:

- rearrange expressions into the form $y = mx + c$;
- plot a graph of y against x and use the graph to find constants m and c in an equation in the form $y = mx + c$.

Graphs

You should be able to:

- include a title and axes which are labelled with scales and units;
- make sure the scales are convenient to use, so that readings may easily be taken from the graph – avoid scales which use factors of 3 – and that the plotted points occupy at least half of both the vertical and horizontal extent of the graph grid;
- first consider carefully whether your plotted points suggest a straight line or a curve - then draw in your best fit line either with the aid of a ruler or (if a curve) by a freehand sketch;
- when extracting data from a graph, use the best-fit line rather than the original data;
- when determining the gradient of a graph, show clearly on your graph the readings you use. This is most conveniently done by drawing a right angled triangle – this should be large so that accuracy is preserved.

Estimating uncertainties

You should be able to:

1. Express uncertainties

Use the form $x \pm u$, where x is the quantity being measured and u its estimated uncertainty.

2. Estimate uncertainties using the resolution of an instrument

If a single reading is taken and there is no reason to believe that the uncertainty is greater, take the uncertainty to be the instrument resolution.

3. Estimate uncertainties using the spread of readings

Take the best estimate of the quantity you are determining as the mean of your readings and the estimated uncertainty to be half the spread in the readings, discounting any suspect readings: i.e. $u = \frac{x_{\max} - x_{\min}}{2}$

4. Percentage uncertainties

The percentage uncertainty, p, is calculated from:

$$p = \frac{\text{estimated uncertainty}}{\text{mean value}} \text{x} 100\%$$

Uncertainties in calculated quantities

1. If a quantity is calculated by **multiplying and/or dividing** two or more other quantities, each of which has its own uncertainty, the percentage uncertainty in the result is found by adding the percentage uncertainties in the quantities from which it is derived.

   e.g. If λ is calculated using $\lambda = \frac{ay}{D}$, the percentage uncertainty in λ is:

   $$p_\lambda = p_a + p_y + p_D$$

2. If a quantity is calculated by multiplying by a **constant**, the percentage uncertainty is unchanged.

3. If a quantity is **raised to a power**, e.g. x^2, x^3 or $\sqrt{x}$, the percentage uncertainty is **multiplied** by the same power.

   Example of 2 and 3: The energy, E, stored in a stretched spring is given by $E = ½\, kx^2$. Both k and x have uncertainties, but $\frac{1}{2}$ has no uncertainty.
   So: $p_E = p_k + 2p_x$

Conclusions and evaluations

You should be able to:

- draw conclusions from an experiment, including determining the values of constants, considering whether experimental data supports a given hypothesis, and making predictions;
- suggest modifications to the experimental arrangement that will improve the accuracy of the experiment or to extend the investigation to answer a new question.

A LEVEL ONLY:

Approach to data analysis

You should be able to:

- rearrange expressions into the forms: $y = ax^n$ and $y = ae^{kx}$;
- plot a graph of $\log y$ against $\log x$ and use the graph to find the constants a and n in an equation in the form $y = ax^n$;
- plot a graph of $\ln y$ against x and use the graph to find the constants a and k in an equation of the form $y = ae^{kx}$.

Graphs

The following remarks apply to linear graphs.

Error bars

The points should be plotted with error bars. These should be centred on the plotted point and have a total length equal to $y_{max} - y_{min}$, for uncertainties in the y values of the points, and $x_{max} - x_{min}$, for uncertainties in the x values of the points. If identical results are obtained the precision of the instrument could be used. If the error bars are too small to plot this should be stated. This will almost certainly be the case for log graphs.

Maximum and minimum gradients

If calculating a quantity such as the gradient or the intercept a line of maximum gradient and a line of minimum gradient should be drawn which are consistent with the error bars. It is often convenient to plot the centroid of the points to help this process. This is the point, $(\overline{x}, \overline{y})$ the mean x value against the mean y value. The line of maximum gradient and the line of minimum gradient should both pass through this point.

Values for the maximum and minimum gradients, m_{max} and m_{min}, [or intercepts, c_{max} and c_{min}] can now be found and the results quoted as:

$$\text{gradient} = \frac{m_{max} + m_{min}}{2} \pm \frac{m_{max} - m_{min}}{2}$$

$$\text{intercept} = \frac{c_{max} + c_{min}}{2} \pm \frac{c_{max} - c_{min}}{2}$$

The following remarks apply to curved graphs.

If the graph is curved error bars should still be plotted (on both axes if possible) and a curve of best fit drawn to enable a tangent to be constructed if the gradient of any point is needed.

Example of good practice

The following results were obtained when the resistance of a coil of wire was measured at different temperatures. The resistance was measured when both heating and cooling the wire so giving two sets of readings. The mean resistance was calculated using:

$$\text{mean resistance} = \frac{R_{\max} + R_{\min}}{2}$$

and the absolute uncertainty calculated using:

$$\text{absolute uncertainty} = \frac{R_{\max} - R_{\min}}{2}$$

Systematic presentation

Consistent sig figs within each column

Headings given with units

Temperature ± 1 / °C	Resistance heating / Ω	Resistance cooling / Ω	Mean resistance / Ω	Absolute uncertainty / Ω
10	4.89	5.05	4.97	0.08
20	5.12	5.24	5.18	0.06
30	5.26	5.34	5.30	0.04
40	5.40	5.60	5.50	0.10
50	5.62	5.80	5.71	0.09
60	5.80	6.00	5.90	0.10
70	5.97	6.13	6.05	0.08
80	6.19	6.31	6.25	0.06

All raw data to the resolution of the instruments used

Processed data to the same number of sig. figs as the raw data

		Carries out techniques or procedures methodically, in sequence and in combination, identifying practical issues and making adjustments when necessary.	1	2	3	4	N/A
		Identifies and controls significant quantitative variables where applicable, and plans approaches to take account of variables that cannot readily be controlled.	1	2	3	4	N/A
		Selects appropriate equipment and measurement strategies in order to ensure suitably accurate results.	1	2	3	4	N/A
3	Safely use a range of practical equipment and materials	Identifies hazards and assesses risks associated with these hazards when carrying out experimental techniques and procedures in the lab or field.	1	2	3	4	N/A
		Uses appropriate safety equipment and approaches to minimise risks with minimal prompting.	1	2	3	4	N/A
		Identifies safety issues and makes adjustments when necessary.	1	2	3	4	N/A
4	Makes and records observations	Makes accurate observations relevant to the experimental or investigative procedure.	1	2	3	4	N/A
		Obtains accurate, precise and sufficient data for experimental and investigative procedures and records this methodically using appropriate units and conventions.	1	2	3	4	N/A
5	Researches, references and reports	Uses appropriate software and/or tools to process data, carry out research and report findings.	1	2	3	4	N/A
		Sources of information are cited demonstrating that research has taken place, supporting planning and conclusions.	1	2	3	4	N/A
